Tokyo Electric Power Company

【Message from the Company】

In 2005, Our Company started as a functional testing business for iron and steel for power generators and electric motors. Subsequently, in response to diverse demands, we have worked to strengthen our existing businesses, and have established a track record in a wide range of fields, including GIS circuit breakers, wind power/solar power, technical contract work, and the sale of new types of energy. Today, our medium-term vision is to be "A company that is expected by its customers and meets their expectations." We are working together to upgrade and improve the skills we have throughout the entire company. The Engineering service offered by Value Base is to create a consecutive framework of integrated technologies and ideas in various fields, in order to become a company that is expected by its customers and meets their expectations.

Engineering requires the ability to cope with all kinds of changes and challenges.

As a group of engineers, Value Base expects to constantly undertake new challenges, bring together the skills, knowledge, experience and ideas of different people, and fully cater to the needs of our customers, thereby accelerating our growth.

In the future, we intend to continue our development with the aim of improving corporate value through inspection and manufacturing in niche fields based upon our core strategies of "strengthening our existing businesses" and "diversification."

President Shigeki Koyama
